REGULARIZATION OF OPTIMAL CONTROL PROBLEMS ON STRATIFIED DOMAINS USING ADDITIONAL CONTROLS

TÉRENCE BAYEN, ANAS BOUALI, AND ALAIN RAPAPORT

This presentation focuses on hybrid optimal control. The goal is to implement a new regularization technique. This technique has the advantage of relying on a weaker transversality assumption than the commonly used transversality conditions. For this purpose, we consider a Mayer optimal control problem governed by a dynamics defined regionally, *i.e.*, the state space is stratified into a family of disjoint regions with nonsmooth interfaces, and, in each region, the dynamics is given by a smooth expression:

$$\dot{x} = f_i(x, u), \quad \text{if } \varphi_i(x) < 0.$$

It is shown that this problem is equivalent to a new optimal control problem, with additional controls v_j taking values in [0, 1] and a (smooth) dynamics as a convex combination of the smooth dynamics $\sum_{j=1}^{N} v_j f_j(x, u_j)$, along with the following mixed control-state constraint:

$$(1 - 2v_j)\varphi_j(x) = |\varphi_j(x)|.$$

Next, we introduce a family of auxiliary optimal control problems. In these problems, we first regularize the nonsmooth interfaces. In addition, we consider the convex combination of smooth dynamics (only) within a boundary layer. Furthermore, we add a penalization term to the cost function to account for the mixed control-state constraint. Our main result is that solutions to these (smooth) problems converge (up to a subsequence) to a solution of the original one. It is obtained thanks to a new hypothesis related to solutions to the auxiliary problems, which is weaker than the transverse crossing condition of the literature.
